[Hackaday links](#)

Posted Oct 8, 2005, 8:00 PM ET by Eliot Phillips

Wow, it's a good time to be a robot:

[William Cox]'s coverage of RoboNexus 2005 continues over at [GoRobotics.net](#). He's been uploading a ton of video from the show. The Roomba hacking kit that was supposed to be released in July [will hopefully be out next month](#). Of note is that it will include an AVR microcontroller dongle that will plug into the serial port. The dongle will have a USB interface for reprogramming. I hope they give full specs so you can plug whatever controller you want into the serial port.

[Nano2x] and [Team 1039 \(FIRST Robotics\)](#) are currently representing at [Robothon](#) in Seattle. They'll be updating their website as the weekend progresses.

The DARPA [Grand Challenge 2005](#) continues. As we write this three vehicles have already completed the 132 mile course. Glad to see things are going better than last year.

IBM developerWorks has had a great series of articles on wireless robotics: [one](#), [two](#), and [three](#). [Richard]

[Restoring Robby the robot](#) [J. Peterson]

Even though PCI is really common it usually doesn't see experimentation by amateurs because of its high performance nature. ChaN decided to build a system to demonstrate that PCI is within the reach of hobbyists. He does this with just 1 GAL, 2 identity comparators, and 4 latches. To pull this off a couple design rules have to be violated. For example: There is no configuration register so the target address has to be set with DIP switches. Something you would never see in real life. ChaN has been posting electronics projects for quite a few years and his site is well worth further investigation.

Hackaday links third shift

Posted Oct 7, 2005, 4:15 AM ET by Eliot Phillips

Yes, [Weblogs, Inc. has been purchased by AOL](#). Should you be worried? Not really. Weblogs, Inc. is still an independent entity from AOL. AOL won't be censoring us or directing us. [grayskies] [hit the nail on the head](#) "How much direction did Weblogs, Inc have on Hack-A-Day? They had the annoying "Best of weblogs inc" and the banner at the top." This deal does mean a better contract and probably more money to throw at projects, contest prizes and schwag. My checks will have AOL on them so I guess I have to stop throwing out the mail from them now.

As a show of good faith, here's a recent article from Linux.ars on [monitoring network traffic with Ruby and pcap](#); the example script is an AIM sniffer.

[Wearable LED display](#)

Posted Oct 5, 2005, 9:30 AM ET by Eliot Phillips

Related entries: [misc hacks](#)

Following these instructions you can add an LED matrix to almost any piece of clothing. The whole display can be controlled using one output for each vertical and horizontal thread. The first step is to solder crimping beads onto each surface mount LED you will be using. Next sew a grid of conductive thread into your garment keeping the vertical and horizontal threads on opposite sides of the fabric. Each of these threads is terminated at a sewn on microcontroller socket. The LEDs are sewn on at each thread junction. She doesn't have any code posted yet unfortunately, but there is an example movie of Conway's Game of Life.

Overclocking a Linksys NSLU2

Posted Oct 4, 2005, 9:30 AM ET by Eliot Phillips

Related entries: [peripherals hacks](#)

[Ro0] seems to think we've been neglecting the NSLU2 or "slug". It's true we have spent a lot of time fawning over the Linksys WRT54G instead. The slug is definitely worthy of attention though. It is a small network appliance with two USB ports that you are supposed to attach disk drives to for simple network storage. Add a little custom firmware and you're free to use the USB ports for whatever you want.

The XScale processor in the slug comes underclocked from the factory. Following the instructions on the NSLU2-Linux wiki you can pop one resistor off of the circuit board to restore the full 266Mhz. Benchmarks, temperature, and power consumption after the change are covered.

[PSP firmware guide](#)

Posted Oct 3, 2005, 3:25 PM ET by Eliot Phillips

Related entries: [playstation hacks](#)

If [Fluke]'s [comment](#) is correct, then the Sony PSP 2.01 firmware is already in the wild. Here is a handy Hack-A-Day guide so you can tell at a glance whether you should upgrade your firmware. All you have to do is compare the firmware version number to the previous release:

- If the first digit has changed (1.5 -> 2.0) then Sony has gotten around to adding a major feature that should have been available since the product's initial release (web browser). Thanks to the magic of firmware upgrades manufacturers can leave lots of features out of product launches.
- If the second digit has changed (1.0 -> 1.5) then Sony has released the hardware in your country. The games aren't region-locked so there is really no reason for the launch delay.
- If the third digit has changed (2.00 -> 2.01) then Sony has decided that you've been having [entirely too much fun](#) with your hardware without their help and are determined to re-break it.

[GBA Variometer](#)

Posted Oct 2, 2005, 9:30 AM ET by Eliot Phillips

Related entries: [gameboy hacks](#)

Variometers are used by para/hang gliders to measure their vertical climb/sink rate. This data helps pilots find and catch thermals. The software runs on a flash ROM cartridge and captures flight data. The data from up to 50 stored flights can be recalled later. The altimeter is a simple pressure transducer that plugs into the link port on the Gameboy Advance.
